

<u>Water and Carbon Cycles</u>	<u>Coastal Landscapes</u>	<u>Hazards</u>
Young people's opinions about big issues such as climate change shouldn't be considered until they are of voting age.	Only areas with high populations deserve protection from coastal erosion	A major natural disaster is the best thing that could ever happen to a LIC.
HICs should be able to offset their country's emissions by exploiting the environment of LICs and NEEs.	The U.K is still experiencing isostatic rebound (<i>the height of the land is increasing following the end of glacial periods</i>) since the last ice age. We don't need to worry about rising sea levels.	LICs will always be severely impacted by hazards no matter what. HICs giving financial aid is pointless.
Countries with higher rates of population growth should contribute a higher percentage of their GDP towards a global carbon tax.	It is too late for many low lying LICs to adapt to rising sea levels. Mass migration is the only way to save lives in the future.	Nothing can be done to mitigate against the effects of future hazards. People should accept this and migrate to safer locations.
People should never buy beef or holiday abroad again if they are serious about cutting their CO2 emissions.	Coastal erosion should not be managed. It is unnatural.	Improvements in human technology will effectively eliminate future hazard risk.

<u>Contemporary Urban Environments</u>	<u>Changing Places</u>	<u>Global Governance</u>
People living in urban areas should not contribute towards coastal defences. It is the responsibility of those who choose to live on the coast.	Places never change, people do. Discuss.	The economic policies of the biggest economies are designed to keep the poorest nations poor
There should be a legal limit to how many people should live in a city.	Northampton High street was voted in the top 10 worst UK high streets in 2019. Future investments are a waste of time and money.	Global trade should be unequal. Discuss.
Social segregation will always be a feature of major cities across the world.	Immigrants living in the U.K have a stronger sense of community than the local population	The natural resources of Antarctica should be free for countries to exploit.
Recycling only encourages more waste to be produced	Demolishing the Weston Favell shopping will only improve the local community identity.	TNCs such as Nike and Shell should be free to leave a country once it has exploited its resources
